

Fulfilling U.S. Government Mandates for Sponsored Projects

Over the years, the U.S. government has consistently supported the telecommunications sector through diverse initiatives aimed at bridging the digital gap. These endeavors often require adherence to specific criteria regarding the origin or composition of materials, as stipulated by the sponsoring project.

FONCS manages four brands that produce a broad range of FTTX products in Mexico, an eligible jurisdiction for many such projects. We source more than 60% of the raw materials for our products from the United States. This ensures that our final offerings align with numerous requirements outlined by these projects.

If you have inquiries regarding the suitability of a particular product for your project and require clarification on compliance matters, we encourage you to contact our team directly or via sales@foncs.com. We are available to assist you with any questions or concerns you may have.

Additionally, it's important to note that while we strive to meet various compliance standards, such as the Buy America Build America, currently, we do not comply with these regulations. Given that we do not operate manufacturing facilities within the United States, we are not in a position to fulfill BABA obligations. However, we are actively monitoring developments and seeking potential waivers or exemptions that may apply to our operations in the future. As circumstances evolve, we remain committed to keeping our consumer base informed about any pertinent updates regarding our compliance status.
